Jigsaw Drop and Picture Blast Solitaire

Gameplay systems progression monetization and social design

Research snapshot 23 October 2026

A detailed public-evidence teardown of Runyou's Jigsaw Drop and Joyteractive/Gismart's Picture Blast Solitaire, with documented features, inspected promotional interfaces, player reports, design interpretation, and unresolved rules kept distinct.

1 Findings and evidence scope

The central design idea is an evolving picture puzzle. The player assembles recognizable images from fragments, completion removes material from the board, and concealed stock supplies the next material to solve. This combines the satisfaction of finishing a small jigsaw with the continuing uncertainty of a card tableau. The important design question is how much the player can plan before the next reveal.

This report separates what can be established from public product evidence from the rules that require an instrumented play session. Official descriptions, release histories, event announcements, promotional interfaces, and customer accounts were inspected. **No installed-app playtest or successfully viewable full gameplay recording was available.** Consequently, this is a detailed public-evidence teardown, not a complete executable specification. The unresolved-rule matrix at the end identifies the exact remaining tests.

Product identity

Field	Jigsaw Drop	Picture Blast Solitaire
Exact product	Jigsaw Drop: Solitaire Puzzle by Runyou Game on iOS and Runyou on Android [1, 2]	Picture Blast Solitaire by Joyteractive on iOS; current Android listing under Gismart [3, 4]
Apple app identifier	6767091927 [1]	6758704957 [3]
Android package	jigsaw.solitaire.match.games.free [2]	com.pic.blast.solitaire [4]
Current inspected iOS release	1.0.18, 4 October 2026 [1]	1.4.3, 19 October 2026 [5]
Inspected Android update date	1 October 2026 [2]	15 October 2026 [4]

These identifiers matter because similarly named picture-solitaire and jigsaw-drop games have different movement rules, economies, and social features. A guide for another package cannot establish a rule here. Equally, iOS and Android evidence should not be combined into an imagined build with every feature shown in every screenshot.

How to read the evidence

Code	Meaning	What the label permits
D	Documented	A developer or platform publication explicitly states the feature.
O	Observed in still media	An interface element or illustrated interaction is visible. Official marketing and the few third-party thumbnails are identified separately; neither settles a move sequence.
V	Observed in gameplay video	A rule is demonstrated in an inspected recording. No claim in this report relies on this category.
R	Player report	A customer describes an experience. It is useful qualitative evidence, not a universal configuration or reproduced test.
A	Analysis	An interpretation, consequence, or design judgment developed from the evidence.
U	Unverified	The available material does not settle the question. This does not mean the feature is absent.

The source references preserve this distinction. A screenshot can establish a displayed balance, but not the cost of a booster. A review can establish frustration with an apparent deadlock, but not prove that the puzzle has no solution. A seasonal event can establish a collection objective without revealing its reward schedule.

2 Jigsaw Drop

Core action and board structure

D — The official loop is to move and connect picture fragments, complete images, clear them, and receive falling replacements. The Apple description explicitly promises no timers. [2, 1]

O — The official store images show upright rectangular fragments on a blue grid, mixing several photographs or illustrations. They depict picture reconstruction rather than matching identical symbols. The following details are visible in particular promotional states.

Element	Observed detail	Evidence limit
Tableau and reserve	A 5×4 grid with five face-down stacks above it. [6]	An advertised example, not a universal board size.
Movement	Opposing arrows link distant cells: row 1 column 2 and row 3 column 5. [6]	Evidence of an intended distant swap; not proof that every possible pair is legal.
Completed image	A finished picture occupies a 2×2 area; another screen highlights a complete Eiffel Tower image. [7, 8]	A demonstrated four-fragment case, not an exhaustive picture-size list.
Replenishment	Cards descend toward open cells, including a depicted flip from a card back. [9]	The image establishes falling replenishment but not its exact order.
Feedback	Glowing completed art, a chain caption, and falling cards under a combo caption. [8, 10]	No multiplier, speed threshold, or scoring equation is published here.
Help control	A lightbulb in the upper right carries a green 8. [6]	A displayed stock count; not a verified new-account grant or price.

Official Jigsaw Drop promotional images. Left: the 5×4 distant-swap example. Right: falling replacements and open cells. These images communicate intended interactions; they are not frames from a captured play session. **[6, 9]**

A — A simple explanatory example is a four-part flower photograph. Its upper-left, upper-right, lower-left, and lower-right portions are mixed among unrelated fragments. Bringing them into the correct 2×2 relationship reconstructs the flower. Removing it makes room for further material. This illustrates the observed four-part pattern; it is not a transcript of a particular shipped level.

The meaningful distinction from a conventional static jigsaw is replenishment. Finishing an image changes the material available for the next decision. A correct local placement is therefore only part of the experience: the player also organizes several unfinished images and tracks the effect of each clear.

How later play differs

O — Three inspected third-party video thumbnails show different board sizes and numbered states. Only the thumbnails were viewable. Their labels and interfaces are lower-confidence evidence than a reproduced session, and they cannot establish the moves leading to the pictured state.

Third-party thumbnail	Displayed state	What it contributes
Nova’s Puzzle Den	Hard 15; 5×5 grid; wand stock 2 and bulb stock 3. [11]	A hard label and larger tableau appear in this presentation.
Mobivision Game	Hard 138; 6×6 grid; wand video offer +2 and bulb stock 3. [12]	A denser tableau and an advertised helper reward are visible in this build.

Third-party thumbnail	Displayed state	What it contributes
Mobivision Game	Level 248; 4×4 grid; wand stock 1 and bulb stock 3. [13]	A later numbered state can be smaller than the earlier hard example.

A — These examples argue against describing progression as a board that simply grows forever. The visible variation is compatible with alternating challenge and relief. A larger board increases simultaneous visual search, while a smaller one may still involve complicated ordering or hidden information. Size is only one possible difficulty variable.

O — Official art marketing spans travel, architecture, animals, landscapes, food, people, painting, and other illustrated subjects. It establishes a broad promoted image library, not a selectable category browser or an exact count of owned pictures. [14]

Helpers feedback and image appreciation

R — An October Apple reviewer describes a wand that supplies needed material and completes a random picture; other Apple reviewers describe viewing or enlarging completed images after a level. These are reported functions, not a verified current targeting rule or permanent-album specification. [1]

R — An Android reviewer mentions jet-associated points and Time, Moves, and Combo grades. The exact units and thresholds are unverified. An elapsed-time grade is compatible with untimed play; it does not establish a countdown. [2]

A — These details suggest two distinct forms of feedback: appreciation of the finished artwork and evaluation of the way the player solved it. The first rewards completion regardless of efficiency. The second can support mastery if its meaning is understandable. Confusing them risks making a relaxing activity feel judged without telling the player how to improve.

Seasonal progression already exists

D — The current Hallow Waltz announcement describes different-difficulty spooky puzzles, pumpkin tokens, hidden stories, illuminated fragments, and a larger panorama to assemble; its headline advertises daily challenges. Exact payouts, unlock thresholds, total panorama size, and expiry were not established. [15]

D — An earlier autumn announcement promoted puzzles of varying difficulty and collectible postcards. This is historical event evidence, not a currently live offer or proof of card trading. [16]

A — The event layer gives repeated solving a destination beyond the next numbered board. Individual images become contributions toward a larger scene or themed collection. That creates a reason to return, but its quality depends on whether players can understand their progress and enjoy what they have completed. Adding another collection is less compelling than making the existing relationship clear.

The public material does not provide a reliable level-by-level unlock schedule. Nor does the mostly generic release history establish when each mechanic was introduced. The strongest account of evolution is therefore the combination of changing board examples, varied image material, helper use, performance feedback, and documented seasonal objectives, with exact configuration reserved for the final validation matrix.

3 Picture Blast Solitaire

Core action and board structure

D — The developer describes assembling images, clearing completed pictures, and revealing hidden cards. The advertised loop is to inspect fragments, bring complementary portions together, finish an image, and continue as new material appears. The publisher positions this as a picture puzzle with card presentation. It does not document Klondike foundations, alternating suits, or ace-to-king sequences. [17]

O — Current Apple media shows more than one board size and image arrangement. The following are specific advertised states, not universal level-unlock rules.

Inspected image	Visible state	Interpretation boundary
Current screenshot 1	Level 16, Special; a 5×5 face-fragment tableau, upper decks, a 0/30 card counter, and 400 coins. A movement arrow leads toward the empty position beside a face half. [18]	The illustrated destination is evidence of the intended interaction, not a complete legality rule for every move.
Current screenshot 2	Level 3; a 5×5 butterfly tableau, completed butterflies, upper decks, 320 coins, and 0/30. Its caption describes new pieces dropping from decks. [19]	Twenty-five visible cells do not establish a twenty-five-piece level because stock can replenish the board.
Current screenshot 3	Halves of food, balls, planets, and a coffee cup, with large recognizable silhouettes. [20]	Visual simplicity is a presentation choice; it is not an accessibility certification.
Current screenshot 5	Top and bottom portions of vases, including joined vertical images and a moving piece. [21]	Recognition depends on relative position as well as object identity. The image does not specify linked-group displacement.
Current screenshot 6	Level 22, Special; a 6×6 nail-art tableau, descending blue-backed cards, 210 coins, and 0/30. [22]	The game should be described as having variable layouts. Neither “always 5×5” nor “always 6×6” fits the inspected material.

Official promotional interfaces from the current Apple listing. Left: the 5×5 face board labeled Level 16. Right: the 6×6 nail-art board labeled Level 22. These are marketing states, not captured live play; displayed numbers are balances and counters, not verified prices or reward amounts. **[18, 22]**

A — The basic cognitive task has two parts. First, identify which fragments belong to the same source image. Second, place those fragments in the correct relative arrangement. Two halves of different faces may have similar skin tones; two portions of the same vase may be distant on the tableau. Recognizing the subject does not automatically resolve the spatial action.

The card metaphor adds a third question: what information is still unavailable? On a static jigsaw, every missing fragment might be somewhere on the table. With concealed stock, a player can spend time searching for a counterpart that has not yet entered the board. A strong understanding of the stock is therefore part of understanding the puzzle, even when the input itself is simple.

The publisher media shows additional systems

The developer website uses another interface set. It should be treated as additional promotional evidence rather than a perfect description of the latest Apple release.

O — Its Level 7 screenshot shows a 6×6 butterfly board, six upper stacks, downward arrows, a progress bar, and a Combo 7 display. Shuffle and lightbulb buttons show inventories of 2 and 7. The combo label establishes feedback for repeated success; it does not disclose a multiplier, timer, or scoring formula. [23]

O — Its Level 12 screenshot shows orange-backed decks, falling replacements, and larger multi-cell pictures including a parrot and a pug. Booster quantities are 1 and 4. Those small numbers are inventory indicators, not demonstrated coin prices. [24]

O — Its home screen shows a level path numbered 17–24, differently styled card nodes, a Hard label on the Play button, and Weekly Story, Home, and Collection navigation. The node icons suggest variation but are not a sufficient rulebook for named modes. [25]

O — Its Collection screen is a partially revealed 6×6 picture, with 21 revealed positions and 15 card backs in that particular state, plus other picture thumbnails. This establishes a persistent visual completion layer. It does not establish a universal thirty-six-win requirement or random acquisition odds. [26]

R — A Google Play customer describes linked pieces remaining together and pictures containing two or four pieces. This supports investigating group movement, but does not settle how a group exchanges places with differently shaped occupied regions. [4]

How play evolves

A — The advertised variation can increase difficulty along separate axes. Similar subjects raise recognition demands. Larger picture footprints raise placement demands. A larger tableau raises search demands. Hidden cards raise uncertainty. A labeled difficult stage may combine several of these. Each axis produces a different player experience, so a credible teardown should not reduce all difficulty to “more pieces.”

For example, a board of highly distinct butterfly wings can make identification easy even when many cells are visible. A smaller board of similar faces can make identification slower. A four-part image introduces the possibility of recognizing a correct partial assembly before the whole picture is available. These are consequences of the puzzle structure, not claims about the shipped level generator's parameters.

The visible level numbers do not prove a fixed curriculum. A screenshot labeled Level 16 does not mean every account first meets that mechanic at sixteen. No exact sequence such as pairs, then four-part images, then concealed tiles at a particular milestone has been established.

R — Later customer accounts include a US player mentioning level 637 and repeated cards, and a UK player describing repeated vases, glasses, or shoes after 200-plus levels. These are signals to examine content reuse and difficulty pacing; they are not verified level caps or measurements of repetition across the whole game. [27, 28]

Progression and product development

D — The Apple release history identifies two major additions to the core loop. Version 1.3.0 on 12 August added Coins, a revised win screen, Memory Cards in the main menu, and a Glass Booster. Version 1.4.0 on 25 September added Daily Streak and Daily Challenges. Later notes describe further levels and fixes. [3]

O — Current Apple marketing also advertises Story Mode through a sequence of romance illustrations: an accidental encounter involving a shopper and security guard, followed by a dinner scene. This is evidence of story presentation, not proof of branching dialogue, romance statistics, a chapter count, or monetized choices. [29]

A — These layers operate at different timescales. A completed picture rewards a few successful actions. A completed stage provides a session-sized milestone. A collection gives finished play a lasting destination. Daily activity creates a reason to return tomorrow. Story supplies a reason to care about the next reveal beyond clearing another board.

The layers can reinforce each other if the connection is legible: solve, receive a visible reward, understand what that reward advances, and see the next attainable goal. They become confusing if a player cannot distinguish the card counter, coin balance, booster stock, collected picture pieces, and story progress. The publicly visible system names are established; the exact exchange relationships are not.

Assistance and mastery

O/D — The visible shuffle and lightbulb controls establish two advertised help affordances; the update notes establish the separately named Glass Booster. The exact function of Glass must not be inferred from its name. A lens-like name could imply revealing, highlighting, or another operation, and the inspected note does not choose among them. [23, 3]

A — Assistance changes the meaning of skill. A hint can teach recognition or planning. A shuffle can recover a weak arrangement. A removal tool can bypass a dependency. These are different interventions even if all help the player finish. An economy analysis needs the actual operation before deciding whether the game sells convenience, information, recovery, or completion.

The most useful measure of mastery would be whether the player increasingly understands why a move is productive. Fast recognition alone does not prove planning depth. Equally, frequent use of assistance does not prove the game is unfair: the board may be difficult, the rules may be poorly explained, the player may prefer speed, or the deal may genuinely require recovery. Those explanations require different design responses.

4 Monetization and the resource economy

What is established

D — Both products are free downloads with advertising declared in their store listings. The inspected US Apple pages did not display an in-app-purchase catalog. No current paid ad-removal product, subscription, coin package, pass, gacha purchase, paid continue, or energy refill price was verified. A missing catalog is not proof that every platform, region, or experiment lacks purchases. [1, 3]

R — Jigsaw customers report ads between levels and ads associated with hints or a wand that completes a picture. Accounts differ on how tolerable the interruptions are. These establish reported placements and assistance, not a universal cadence or exact current offer. [1, 2]

R/D — Picture Blast customers report mid-play interruptions and reward/help advertising. A developer reply on 3 July said ad settings would be reviewed and ad removal was being considered. An October customer reported a reward-ad problem had been fixed. The July reply does not establish a purchasable no-ads option today, and the resolved complaint should not be presented as an ongoing universal defect. [4]

The verified resource map is incomplete

Resource or transaction	Jigsaw Drop	Picture Blast Solitaire
Persistent progression	Numbered play and event/image completion are discussed in the product-specific section.	Numbered play, collection, daily activity, and story are discussed in the product-specific section.
Currency evidence	Halloween pumpkin tokens are explicitly named in the event announcement. [15]	Coins are named in the update history and balances appear in current media. [3, 18]
Assistance evidence	Promotional help inventory and customer reports exist; a full supply and cost schedule is unverified.	Promotional booster inventories and named update additions exist; a full supply and cost schedule is unverified.
Real-money catalog	No current SKU and price verified.	No current SKU and price verified.
Stamina or lives	Unverified.	Unverified.
Recurring payment	Unverified.	Unverified.
Paid randomized acquisition	Unverified.	Unverified.

A — Currency names alone do not reveal an economy. A complete economy diagram requires sources, sinks, amounts, and conversion rules. Coins could buy assistance, unlock imagery, or have another role; the inspected materials do not establish the complete mapping. Likewise, a collectible card is not automatically the outcome of a randomized pack, and a seasonal token is not automatically a premium currency.

The relevant distinction is between what the player owns and what the player can do. A booster stock number expresses a remaining action count. A currency balance expresses spending capacity only after a price is known. A collection counter expresses progress only after its unit and target are understood. Treating all three as interchangeable “rewards” hides the actual incentive structure.

Why advertising is structurally important

A — The likely economic tension sits at the transition from concentration to interruption. The player is maintaining a mental map of fragments, positions, and possible partners. An interruption can erase part of that working context. A break between completed boards has a different cognitive cost from a break after a selected fragment but before the result of its move.

A rewarded-help offer can feel voluntary when the player understands the board and chooses a shortcut. It can feel compulsory when the player believes the only possible continuation is an ad. Customer descriptions establish that perception in some sessions, but do not establish the developer's intent or prove that the board is mathematically impossible.

The purchase question is therefore only one part of monetization quality. The other parts are predictable placement, honest help descriptions, preserved board state, reliable reward delivery, and a clear free recovery path where appropriate. These are product implications, not verified statements about the current implementation.

No public evidence reviewed here supports a revenue estimate, payer conversion rate, average revenue per player, retention curve, impression frequency, or lifetime-value calculation. Store download bands and review counts cannot substitute for those measurements.

5 Social systems platform behavior and comfort

Solo retention is the visible emphasis

D — Jigsaw is explicitly labeled single-player and offline, and its description says an internet connection is unnecessary. That does not establish whether every seasonal activity, reward claim, or advertising feature works offline. Picture Blast's complete offline behavior was not established in the inspected official material. [2]

A — The strongest supported retention model is personal progress: another board, another completed image, a collection milestone, and where documented, a scheduled activity or story reveal. These systems can create a durable habit without direct player-to-player interaction. A streak is a scheduling system; it is not evidence of a competitive league.

Friends, invitations, gifting, teams, guilds, chat, competitive leagues, live PvP, cooperative picture assembly, trading, public leaderboards, platform achievements, and cross-device restore remain unverified for these exact products. This is a research status, not a definitive feature-absence claim. A store-page Share button is not evidence of in-game sharing.

The generic Runyou and Joyteractive policies discuss possible account, social-login, or purchase data across their products. Those clauses do not establish that these two titles expose a particular account or social feature. A title-specific interface or support document is required. [30, 31]

Persistence deserves its own audit

A — A puzzle's apparent simplicity can hide expensive persistence failures. Losing one move is irritating; losing a completed hard stage, an earned reward, or collection progress can undermine the longer-term reason to play. An exact technical teardown would test interruption during a drag, completion animation, rewarded ad, reward claim, and app restart separately.

It would also distinguish local save, account linkage, cloud synchronization, cross-platform transfer, reinstall recovery, and offline reconciliation. These are different promises. None should be inferred from the general fact that the game has ongoing levels or from a platform's generic account marketing.

Visual and accessibility considerations

R — Picture Blast's public review feeds include requests for larger cards and an account of discomfort with a large board's pulsing or movement. These justify targeted legibility and motion tests; they do not quantify the prevalence of an accessibility problem. [28]

A — Readability is part of the rule system. The player must identify the image, understand its orientation, locate a valid destination, and perceive what changed after movement. An attractive illustration can still be a poor puzzle fragment if its distinguishing feature lies outside the visible crop or if several fragments look almost identical at phone scale.

Comfort therefore depends on more than visual polish. Selection feedback, card separation, motion amplitude, the duration of completion effects, and the distinction between a hidden card and an empty slot all affect whether the player can maintain an accurate model of the board. These are the criteria used in the separate improvement proposal.

6 What the designs are doing

The attraction of repeated small completions

A — Both designs make partial progress visible at a very small scale. The player does not need to finish an entire large picture before receiving a recognizable result. A correct connection can produce an immediate “that belongs there” response; a finished image provides a larger payoff; a stage supplies a further boundary.

This nested reward structure is well suited to short sessions. It also creates a risk: if every completion instantly disappears, the player may appreciate the act of solving more than the earned picture. A durable gallery, story, or panorama can preserve some of that value after the board has moved on. The existence of an image collection and the quality of that collection's payoff are separate questions.

Recognition depth and planning depth

A — A game can be demanding without being deeply strategic. Searching a crowded tableau for a matching half may take time and attention. Planning requires a choice whose consequences matter: which image to clear first, which region to free, what information to reveal, or whether to preserve a useful group.

The public materials establish recognition and assembly. They do not fully settle how strongly alternative move orders affect future solvability. That distinction is the central unresolved design question. If every valid image can be cleared in any order with little consequence, the experience is chiefly visual organization. If clearing one region changes access to crucial material elsewhere, it can support meaningful planning.

Neither structure is automatically better. Visual organization can be relaxing and accessible. Planning can be more satisfying but also increases explanation requirements and the frustration cost of uncertainty. The right evaluation asks whether the decision burden matches the product's promise and audience.

Novelty has several independent forms

Form of novelty	What changes for the player	Design implication
New subject matter	What the player recognizes	Expands visual freshness without necessarily changing the decision.
New fragment geometry	How an image must be assembled	Can change the spatial task while retaining familiar input.
New information structure	What the player can know before acting	Can introduce planning, uncertainty, or misleading searches.
New board topology	Where groups fit and which regions interact	Can change routing and order-of-operations demands.
New objective	What counts as success	Can produce a distinct puzzle even with familiar fragments.
New meta reward	Why the next board matters	Supports return motivation without changing the immediate move.

These are analytical categories, not a claim that either product implements every one. They provide a useful lens for evaluating late-game evolution. A large content count can still feel repetitive if only subject matter changes. Conversely, a small visual library can remain interesting if familiar material supports different decisions.

Trust is a design resource

A — The hidden stock creates an asymmetry: the system may know more about the board than the player. When a player becomes stuck, uncertainty about the rules can turn into uncertainty about fairness. The player may not know whether a partner is hidden, whether a legal move has been overlooked, whether a group blocks the route, or whether a recovery action is genuinely necessary.

This makes clarity economically consequential. If help is monetized before that distinction is explained, an otherwise ordinary recovery mechanic can feel like manufactured obstruction. If the game explains the state and offers a dependable response, help can feel like a service. The public complaints are enough to justify testing this issue; they are not enough to decide which explanation is true for every board.

The strongest opportunity across the two products is to connect three kinds of clarity: the immediate move, the reason a reward was earned, and the lasting thing that reward advances. The separate proposal turns that principle into concrete priorities, experiments, and a potential stronger puzzle mode.

7 Exact unresolved rules and the validation needed

This is the consolidated limit of the public teardown. A faithful mechanical recreation, numerical economy model, or definitive feature inventory needs the following evidence. Unknown values should remain unknown rather than be filled with genre conventions.

Question	Present evidence boundary	Required observation
Legal moves	Promotional relocation and swapping are visible; the complete legality function is not.	Test distant and adjacent destinations, empty and occupied cells, non-matching swaps, and rejected inputs.
Connected groups	Larger assemblies are advertised and players describe linked pieces.	Move groups of unequal shape; test separation, overlap, edge constraints, and displaced-piece order.
Rotation	No complete rotation rule established.	Inspect input help and test whether orientation is fixed across each stage type.
Completion	Finished pictures clear in the advertised loop; exact checks are unpublished.	Record the smallest successful assembly, simultaneous completions, duplicates, and partially correct groups.
Refill and gravity	Upper decks and descending replacements are visible.	Track every slot after a clear: compaction, column ownership, reveal order, automatic cascades, and deck exhaustion.
Randomness and solvability	No generator configuration or solution guarantee verified.	Replay the same deal, compare retries and sessions, record seeds if exposed, and solve the resulting state graph.
Win and loss	Numbered completion exists; exact terminal and failure predicates are unresolved.	Observe last-card states, no-progress states, restart, surrender, timer or move limits, and any resource gate.
Counters and scoring	Progress indicators and combo-related UI appear.	Measure each increment; identify units, score multipliers, grade thresholds, reset conditions, and whether scores buy anything.
Boosters	Names, icons, stocks, and player accounts identify assistance.	Record each effect, target rule, first grant, free use, purchase/reward offer, quantity, cooldown, and refund behavior.
Economy	Some currencies and collection systems are named.	Build a transaction ledger covering all sources, sinks, prices, grants, duplicates, and platform-specific storefronts.

Question	Present evidence boundary	Required observation
Progression schedule	Numbered stages and feature additions are documented.	Follow a clean account through actual unlocks; distinguish fixed milestones from experiments and promotional examples.
Daily events and story	Scheduled activities and narrative presentation are advertised.	Record entry rules, refresh time, reward track, expiry, missed-day policy, replay, and permanent versus temporary ownership.
Advertising	General support and individual placements are established.	Log eligible triggers, actual displays, length, no-fill behavior, frequency limits, interruption recovery, and reward delivery.
Social and persistence	Complete title-specific support is unverified.	Inspect account settings, friend/team interfaces, save migration, reinstall, multi-device conflicts, and offline reconciliation.

For a reliable follow-up, record platform, region, build, install date, and account cohort before testing. Capture the tutorial and each new stage variant. For a move, log the origin, destination, linked shape, displaced fragments, completed image, stock draw, counter change, and available next actions. This creates an exact rule specification instead of a recollection of how the game seemed to behave.

For the economy, begin with a balance snapshot and record every grant and spend. For advertising, distinguish an offer being shown from an ad actually playing and a promised reward being delivered. For progression, distinguish an interface being advertised from the account actually unlocking it. These separations are what would turn the current public-evidence analysis into a complete versioned product audit.
